PSO 12

Minimum Spanning Trees, Prim's vs. Kruskal's, Topos == DAG

Slides @ justin-zhang.com/teaching/CS251

(Minimum spanning trees)

- 1. An edge is called a <u>light-edge</u> crossing a cut $\mathcal{C} := (S, V S)$, if its weight is the minimum of any edge crossing the cut. Show that:
 - if an edge (u, v) is contained in some MST, then it is a light-edge crossing some cut of the graph.
 - the converse is not true, and give a simple counter-example of a connected graph such that there
 exists a cut C := (S, V − S), in which (u, v) is a light-edge crossing the cut C but does not form a
 MST of the graph.
- Show that a graph has a unique MST, if for every cut of the graph, there is a unique light-edge crossing the cut. Show that the converse is not true by giving a counter-example.
- 3. Let T be an MST of a graph G = (V, E), and let V' be a subset of V. Let T' be the subgraph of T induced by V', and let G' be the subgraph of G induced by V'. Show that if T' is connected, then T' is an MST of G'.

(Prim's & Kruskal's algorithm)

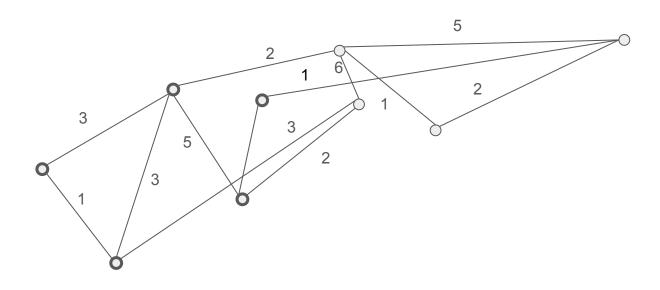

- 1. Suppose that we represent the graph G = (V, E) as an adjacency-matrix. Give a simple implementation of Prim's algorithm for this case that runs in $O(|V|^2)$ time.
- 2. Suppose that all edge weights in a graph are integers in the range from 1 to |V|. How fast can you make Kruskal's algorithm run?

(Topological Ordering)

- 1. Draw a directed acyclic graph G=(V,E) with |V|=5 nodes that has exactly two topological orderings.
- 2. Prove that G has a topological ordering if and only if G is a DAG.

(Minimum spanning trees)

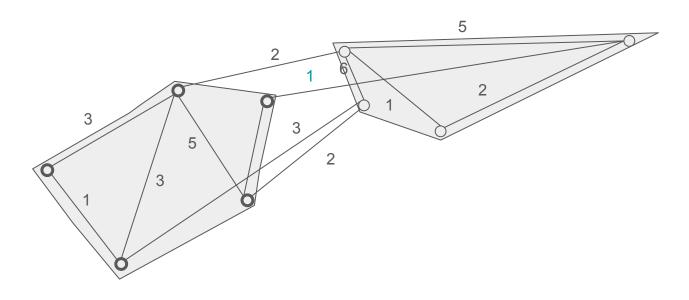

1. An edge is called a <u>light-edge</u> crossing a cut $\mathcal{C} := (S, V - S)$, if its weight is the minimum of any edge crossing the cut. Show that:

Say I define C as

(Minimum spanning trees)

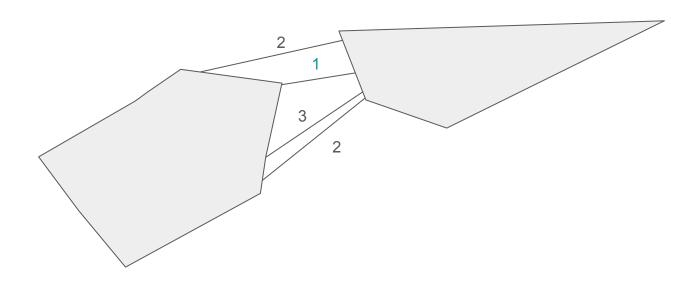

1. An edge is called a <u>light-edge</u> crossing a cut $\mathcal{C} := (S, V - S)$, if its weight is the minimum of any edge crossing the cut. Show that:

This forms a 'cut'

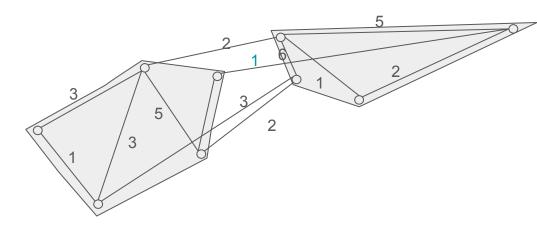

(Minimum spanning trees)

1. An edge is called a <u>light-edge</u> crossing a cut $\mathcal{C} := (S, V - S)$, if its weight is the minimum of any edge crossing the cut. Show that:

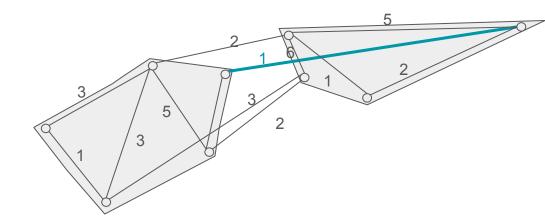

The light edge of this cut has weight 1

<u>Pf</u>:

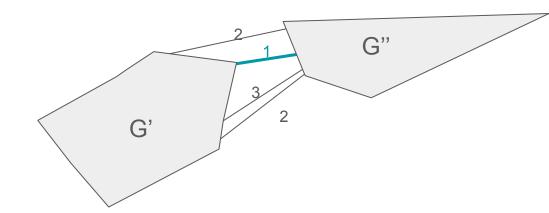

Pf: AFtSoC e is not in a MST

[What happens in the picture?]

Pf: AFtSoC e is not in a MST

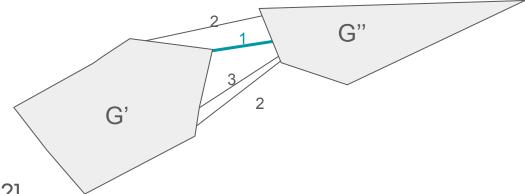

[What happens in the picture?]

Pf: AFtSoC e is not in a MST

In an MST, G' and G" must be connected.

[How can we get our contradiction?]

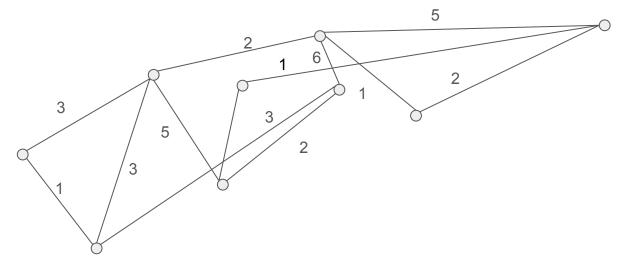

(Minimum spanning trees)

1. An edge is called a <u>light-edge</u> crossing a cut $\mathcal{C} := (S, V - S)$, if its weight is the minimum of any edge crossing the cut. Show that:

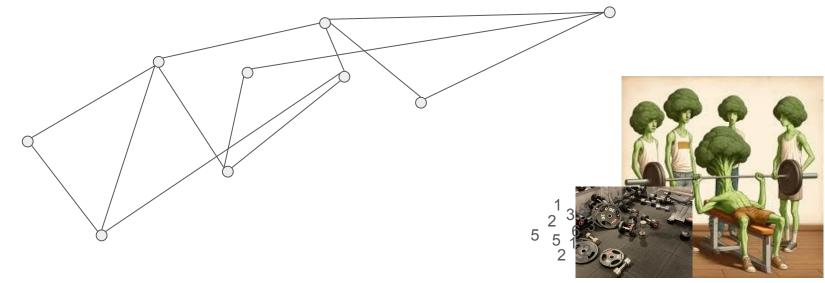

"If e is the light edge of some cut, then it is in every MST."

Show that this is false.

Suppose each cut has a unique light edge. **WTS**: the graph has a unique MST Proof by picture!

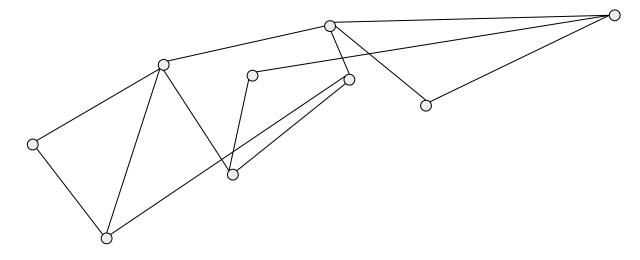

Suppose each cut has a unique light edge. **WTS**: the graph has a unique MST Proof by picture!

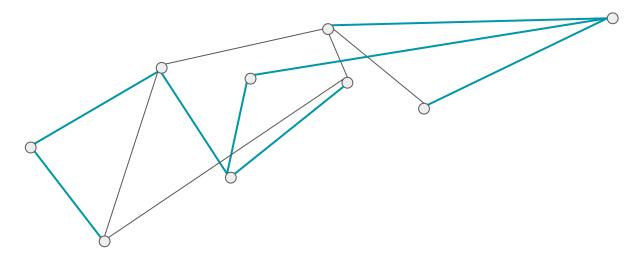

(Me and my bois have taken all the weights off the graph (we need them for our super set))

Suppose each cut has a unique light edge. **WTS**: the graph has a unique MST Proof by picture!

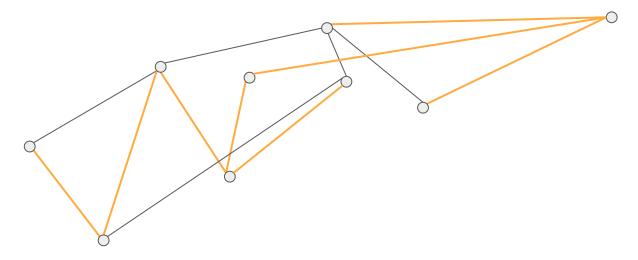

AFtSoC there are two different MSTs T₁ and T₂

Suppose each cut has a unique light edge. **WTS**: the graph has a unique MST Proof by picture!

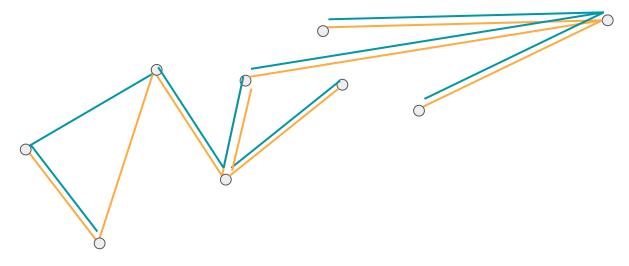

AFtSoC there are two different MSTs T_1 and T_2

Suppose each cut has a unique light edge. **WTS**: the graph has a unique MST Proof by picture!

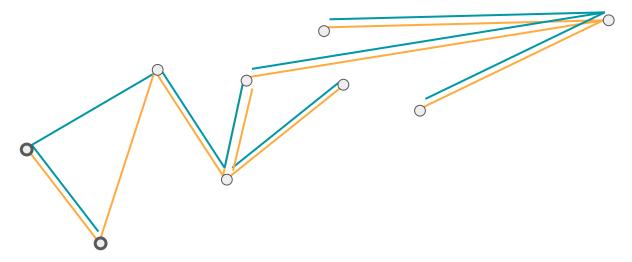

AFtSoC there are two different MSTs T₁ and T₂

Suppose each cut has a unique light edge. **WTS**: the graph has a unique MST Proof by picture!

 T_1 and T_2 differ on some edges e_1, e_2

Suppose each cut has a unique light edge. **WTS**: the graph has a unique MST Proof by picture!

 T_1 and T_2 differ on some edges e_1, e_2 . Consider cut **C** defined above.

Suppose each cut has a unique light edge. WTS: the graph has a unique MST

 T_1 and T_2 differ on some edges e_1, e_2 . Consider cut **C** defined above.

Suppose each cut has a unique light edge. WTS: the graph has a unique MST

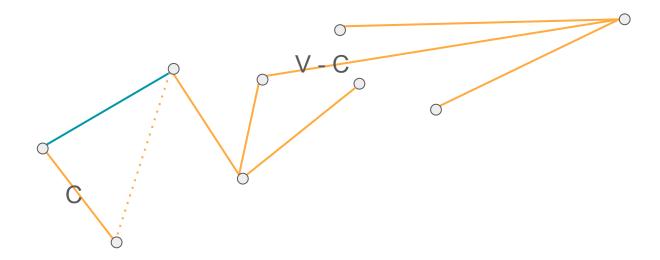

By our assumption, say e_1 is our unique light edge in cut C i.e., $wt(e_1) < wt(e_2)$

Suppose each cut has a unique light edge. **WTS**: the graph has a unique MST Proof by picture!

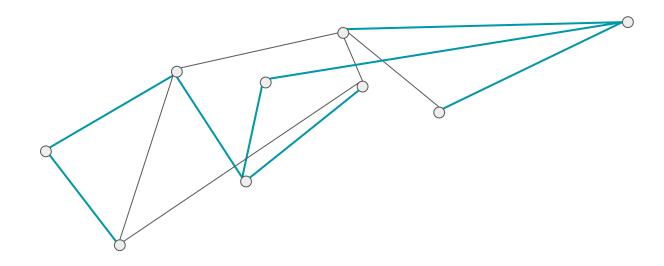

But if $wt(e_1) < wt(e_2)$, then we can lower the weight of MST T_2 by taking e_1 instead of e_2

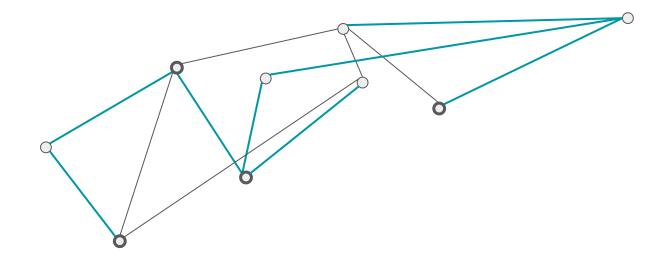

But if $wt(e_1) < wt(e_2)$, then we can lower the weight of MST T_2 by taking e_1 instead of e_2

Time for the counter example

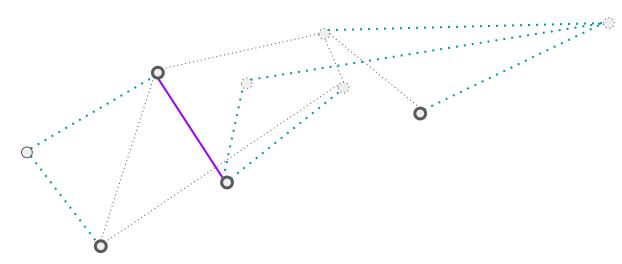

Let this be the graph G and mst T

Let this be the graph G and mst T

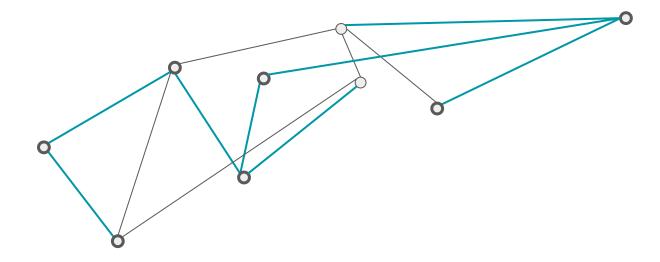

Suppose we define **V**' as follows

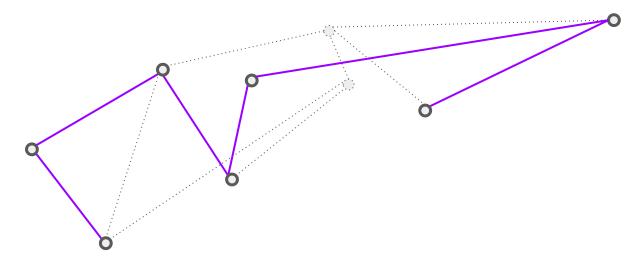

Suppose we define **V'** as follows. This is **T'**, **T** induced by **V'**What went wrong? Why isn't a **T'** MST?

Let this be the graph G and mst T

Suppose we define **V**' as follows

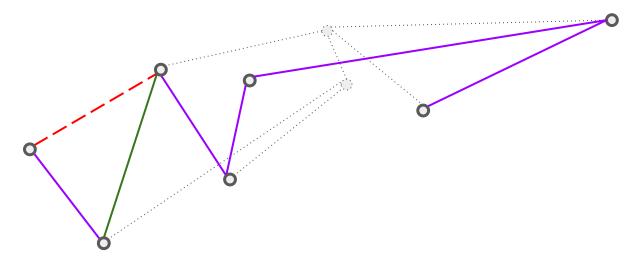

Let this be the graph G and mst T

Suppose we define V' as follows. This is T', T induced by V'

WTS: this is an MST of V'

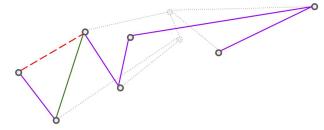

Let this be the graph G and mst T

WTS: this is an MST of V'

AFtSoC there is a cheaper tree T" differing in edges above (added, removed)

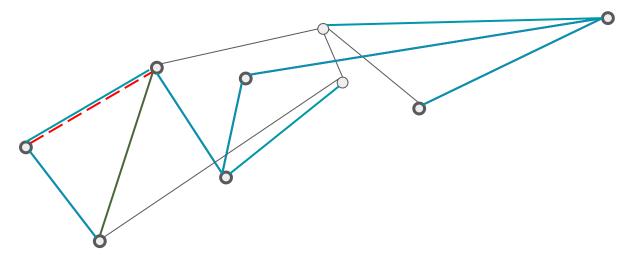

3. Let T be an MST of a graph G = (V, E), and let V' be induced by V', and let G' be the subgraph of G induced \mathbb{I} is an MST of G'.

Let this be the graph G and mst T

WTS: this is an MST of V'

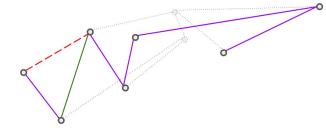

AFtSoC there is a cheaper tree T" differing in edges above (added, removed)

WTS: this is an MST of V'

Back in the original graph we originally had MST T

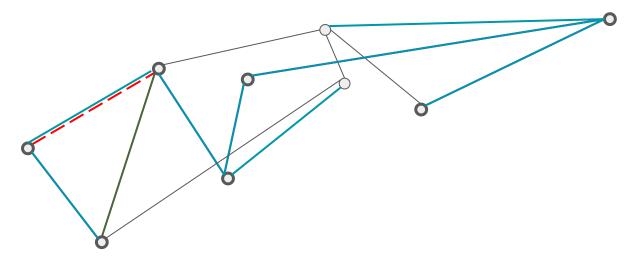

3. Let T be an MST of a graph G=(V,E), and let $V^{'}$ be induced by $V^{'}$, and let $G^{'}$ be the subgraph of G induced \mathbb{I} is an MST of $G^{'}$.

Let this be the graph G and mst T

WTS: this is an MST of V'

AFtSoC there is a cheaper tree T" differing in edges above (added, removed)

WTS: this is an MST of V'

Removing the red edge and adding the green edge gives us a cheaper tree

(Prim's & Kruskal's algorithm)

- 1. Suppose that we represent the graph G = (V, E) as an adjacency-matrix. Give a simple implementation of Prim's algorithm for this case that runs in $O(|V|^2)$ time.
- 2. Suppose that all edge weights in a graph are integers in the range from 1 to |V|. How fast can you make Kruskal's algorithm run?

Simple Intuition of Prim's algorithm?

(Prim's & Kruskal's algorithm)

1. Suppose that we represent the graph G = (V, E) as an adjacency-matrix. Give a simple implementation of Prim's algorithm for this case that runs in $O(|V|^2)$ time.

Dijkstra

```
algorithm DijkstraShortestPath(G(V,E), s \in V)
   let dist:V \to \mathbb{Z}
   let prev:V \rightarrow V
   let Q be an empty priority queue
   dist[s] \leftarrow 0
   for each v \in V do
       if v \neq s then
           dist[v] \leftarrow \infty
       end if
       prev[v] \leftarrow -1
       Q.add(dist[v], v)
    end for
   while Q is not empty do
       u \leftarrow Q.getMin()
       for each w \in V adjacent to u still in Q do
           d \leftarrow dist[u] + weight(u, w)
           if d < dist[w] then</pre>
               dist[w] \leftarrow d
              prev[w] \leftarrow u
              Q.set(d, w)
           end if
       end for
   end while
   return dist, prev
end algorithm
```

Prim's

Prim's MST

```
algorithm DijkstraShortestPath(G(V,E), s \in V)
    let dist:V \to \mathbb{Z}
   let prev:V \rightarrow V
   let Q be an empty priority queue
    dist[s] \leftarrow 0
    for each v \in V do
       if v \neq s then
           dist[v] \leftarrow \infty
        end if
       prev[v] \leftarrow -1
        Q.add(dist[v], v)
    end for
   while Q is not empty do
       u \leftarrow Q.getMin()
       for each w \in V adjacent to u still in Q do
           d \leftarrow \frac{\text{dist}[u] + \text{weight}(u, w)}{}
           if d < dist[w] then</pre>
               dist[w] \leftarrow d
               prev[w] \leftarrow u
               Q.set(d, w)
           end if
        end for
    end while
    return dist, prev
end algorithm
```

(Prim's & Kruskal's algorithm)

1. Suppose that we represent the graph G = (V, E) as an adjacency-matrix. Give a simple implementation of Prim's algorithm for this case that runs in $O(|V|^2)$ time.

Prim's MST

```
algorithm DijkstraShortestPath(G(V, E), s \in V)
   let dist:V \to \mathbb{Z}
    let prev:V \rightarrow V
   let Q be an empty priority queue
    dist[s] \leftarrow 0
    for each v \in V do
        if v \neq s then
           dist[v] \leftarrow \infty
        end if
       prev[v] \leftarrow -1
       Q.add(dist[v], v)
    end for
    while Q is not empty do
       u \leftarrow 0.getMin()
       for each w \in V adjacent to u still in Q do
           d \leftarrow \frac{dist[u]}{dist[u]} + weight(u, w)
           if d < dist[w] then</pre>
               dist[w] \leftarrow d
               prev[w] \leftarrow u
               0.set(d, w)
           end if
        end for
    end while
    return dist, prev
end algorithm
```

```
Pseudocode
```

//Some other initialization

Let dist[v] = current min. edge to v

while pq is not empty:

Vertex u <- pq.pop()

for each edge (u,v):

if wt(u,v) < dist[v]:

update dist and pg

What we can do with an adj matrix

(Prim's & Kruskal's algorithm)

1. Suppose that we represent the graph G = (V, E) as an adjacency-matrix. Give a simple implementation of Prim's algorithm for this case that runs in $O(|V|^2)$ time.

Prim's MST

```
algorithm DijkstraShortestPath(G(V, E), s \in V)
   let dist:V \to \mathbb{Z}
    let prev:V \rightarrow V
   let Q be an empty priority queue
    dist[s] \leftarrow 0
    for each v \in V do
        if v \neq s then
           dist[v] \leftarrow \infty
        end if
       prev[v] \leftarrow -1
       Q.add(dist[v], v)
    end for
    while Q is not empty do
       u \leftarrow 0.getMin()
       for each w \in V adjacent to u still in Q do
           d \leftarrow \frac{dist[u]}{dist[u]} + weight(u, w)
           if d < dist[w] then</pre>
               dist[w] \leftarrow d
               prev[w] \leftarrow u
               0.set(d, w)
           end if
        end for
    end while
    return dist, prev
end algorithm
```

```
Pseudocode
```

//Some other initialization Let dist[v] = current min. edge to v while pg is not empty: Vertex u <- pq.pop() for each edge (u,v): if wt(u,v) < dist[v]: update dist and pg

What we can do with an adj matrix

(Prim's & Kruskal's algorithm)

1. Suppose that we represent the graph G = (V, E) as an adjacency-matrix. Give a simple implementation of Prim's algorithm for this case that runs in $O(|V|^2)$ time.

Prim's MST

```
algorithm DijkstraShortestPath(G(V, E), s \in V)
    let dist:V \to \mathbb{Z}
    let prev:V \rightarrow V
   let Q be an empty priority queue
    dist[s] \leftarrow 0
    for each v \in V do
        if v \neq s then
           dist[v] \leftarrow \infty
        end if
       prev[v] \leftarrow -1
       Q.add(dist[v], v)
    end for
    while Q is not empty do
       u \leftarrow 0.getMin()
       for each w \in V adjacent to u still in Q do
           d \leftarrow \frac{dist[u]}{dist[u]} + weight(u, w)
           if d < dist[w] then</pre>
               dist[w] \leftarrow d
               prev[w] \leftarrow u
               0.set(d, w)
            end if
        end for
    end while
    return dist, prev
end algorithm
```

Pseudocode

//Some other initialization

Let dist[v] = current min. edge to v

while pq is not empty:

Vertex u <- pq.pop()

for each edge (u,v):

if wt(u,v) < dist[v]:

update dist and pq

What we can do with an adj matrix What we cannot do (right away)

(Prim's & Kruskal's algorithm)

1. Suppose that we represent the graph G = (V, E) as an adjacency-matrix. Give a simple implementation of Prim's algorithm for this case that runs in $O(|V|^2)$ time.

```
//Some other initialization
//Some other initialization
                                                      Let dist[v] = current min. edge to v
Let dist[v] = current min. edge to v
     while pg is not empty:
           Vertex u <- pq.pop():</pre>
           for each edge (u,v):
                 if wt(u,v) < dist[v]:
                                                                         if wt(u,v) < dist[v]:
                             update dist and pg
                                                                             update dist
```

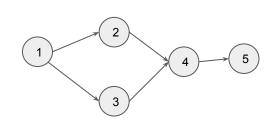

(Topological Ordering)

- 1. Draw a directed acyclic graph G=(V,E) with |V|=5 nodes that has exactly two topological orderings.
- 2. Prove that G has a topological ordering if and only if G is a DAG.

When do we have two topo orderings?

2. Prove that G has a topological ordering if and only if G is a DAG.

(→) Suppose G has a topo ordering (WTS: DAG)

(←) Suppose G is a DAG (**WTS**: topo ordering)
